submitted to the EMBL Data Library, September 1994
Identification of a novel component of the nonsense-mediated
mRNA decay pathway using an interacting protein screen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

KOERTNER C., LAUTERBACH F., TRIPIER D., UNDEN G., KROEGER A.;

MOL. MICROBIOL. 4:855-860(1990).

-!- FUNCTION: DI-HEME CYTOCHROME OF THE FUMARATE REDUCTASE COMPLEX.

-!- SUBUNIT: PART OF AN ENZYME COMPLEX CONTAINING THREE SUBUNITS:

A FLAVOPROTEIN, AN IRON-SULFUR PROTEIN AND A CYTOCHROME B.

-!- SIMILARITY: TO CYTOCHROME B-558 FROM B.SUBTILIS SUCCINATE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          TRICARBOXYLIC ACID CYCLE; TRANSMEMBRANE; ELECTRON TRANSPORT; HEME. I. FUNCTION: CATALYZES THE BIOSYNTHESIS OF 4-AMINO-4-DEOXYCHORISMATE (ADC) FROM CHORISMATE AND GLUTAMINE.
I. PATHWAY: FOLATE BIOSYNTHESIS OF PAMINOBROATE (FABA).
I. SUBUNIT: CONSISTS OF TWO NONIDENTICAL CHAINS: COMPONENT I CATALYZES THE FORMATION OF ADC BY BINDING CHORISMATE AND AMMONIA, COMPONENT II PROVIDES THE GLUTAMINE AMIDOTRANSFERASE ACTIVITY.

SUBMITTED (DEC-1995) FOR EML/GENBANK/DDBJ DATA BANKS.
-!- FUNCTION: THIS PROTEIN BINDS 58 RNA.
-!- FUNCTION: THIS PROTEIN BINDS 58 RNA.
-!- SIMILARITY: BELONGS TO THE L18P FAMILY OF RIBOSOMAL PROTEINS.

J. MOL. BIOL. 162:729-773(1982).

-!- FUNCTION: GENE J PROTEIN MAKES UP THE DISTAL FIBER OF THE PHAGE
TAIL. IT IS RESPONSIBLE FOR ADSORPTION TO THE HOST DUBING
INFECTION AND DEPERMINES HOST SPECIFICITY. IT SPECIFICALLY BINDS
TO THE LAMBDA RECEPTOR PROTEIN OF E.COLI K12.

-!- UNDER THE ACTION OF THE GENE G, T, H, M, L, K, AND I PROTEINS,
C. GENE J PROTEIN SERVES AS THE INITIATOR OF TAIL POLYMERIZATION.
THERE ARE 2-4 COPIES OF PROTEIN J PER MATURE PHAGE.

CELL 82:785-794(1995)
-!- FUNCTION: UDDEL, PIDE AND WINDBEUTEL TOGETHER TRICGER THE PROTEASE
-!- FUNCTION: UDDEL,
CASCADE WITHIN THE EXTRAEMBRYONIC PERIVITELLINE COMPARTMENT WHICH
INDUCES DORSOVENTRAL POLDARITY OF THE DROSOPHILA EMBRYO. NUDEL IS
DIRECTLY INVOLVED IN LOCALLY PRODUCING THE TOLL LIGAND.
-!- TISSUE SPECIFICITY: FOLLICLE.
-!- PTM: REQUIRES CLEAVAGE FOR ACTIVATION (PRESUMABLY).
-!- SUBCELLULAR LOCATION: EXTRACELLULAR MATRIX.
-!- SUBLEMILARITY: BELONGS TO PEPTIDASE FAMILY S1; ALSO KNOWN AS THE
TRYPSIN FAMILY.
-!- SIMILARITY: CONTAINS 11 LDL-RECEPTOR CLASS A DOMAINS.

POINTUCLEOTIES sequences encoding new proto:cadherins - useful polynucleotide sequences encoding me proto:cadherins - useful polynucleotide sequences encoding and regulating activities.

Example; Page 63; 114pp; English.

Example; Page 63; 114pp; English.

Tor regions of conserved As sequence, one from the middle of the corresp. Corresp. Condomain (EC-3) and the other from the corresp. Corresp. Gegenerate oligos (06894), 068950) were designed for use as PCR primers. PCR was carried out on a rat brain condomain (ED-3) and the other from the condomain (ED-4) were corresp. Two major bands of about 450 bps and 130 bps were found. The 450 bp band corresponded to the expected length between the two primer sites, but the 130 bp band could not be predicted from any of the previously identified cadherin sequences. The 450 bp and 130 bp bands were extracted and sequenced. Nineteen novel partial cDNA clones were isolated. The DNA and deduced As sequences of the corresp. to the PCR primers) are given in 068951-068969 and R58860-R58878. Various cDNA fragments structurally similar to the rat cDNAs were isolated from human, structurally similar to the rat cDNAs were isolated from human, couse and Kenopus brain cDNA prepns. by PCR using the above primers. The DNA and deduced As sequences corresp. to the PCR primers) are given in the DNA and deduced and R5882-R58905 and R49143. Comparison of the deduced As sequences indicates a similarity, in particular,
                                                                                                                                                                                                                                                                                                                                                                                                                            isolated nonsense-mediated mRNA decay gene and protein - used to develop methods for inhibiting the decay pathway for producing heterologous or endogenous proteins.

Claim 8; Page 49-52; 73pp; English.

The NMD2 gene (T31993) is named after its role in the Nonsense-Mediated mRNA becay pathway. The protein, NMG2p, binds to Upfip.

A C-terminal fragment of the protein (T31994) also binds Upfip and, when overexpressed in the host cell, the fragment inhibits the function of Upfip, thereby inhibiting the nonsense-mediated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score 47; DB 19; Length 108

T related DNA, with high activity against dipteran larvae, e.g.

T Amegyptit, A.stephensi or C.pipiens
Claim 17: Fig 5: 55pp; French.
C flaim 17: Fig 5: 55pp; French.
C from Bacilius thuringiensis ser. jegathesan 367 (Btjeg367); it is a crystal toxin of mol. wt. 80 kD which is active against dipteran insects, esp. mosquitoes. The full-length, recombinant JEG80 toxin, chad mean LC50 values (in ng/ml) after 48 hours of 18.8, 42.7 and 10.1 against larvae of Aedes aegypti, Anopheles stephensi and Culex pipiens, respectively. Wild-type Btjeg367 crystals gave values of 47.4, 54.5 and 9.6. The JEG80 protein is far more toxic (6-40 times coxin, despite their close sequence similarity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

RR142-RR144 represent partial fragments of the drosophila protocadherin sequence. The cDNAs encoding these sequences were isolated after conscienting a drosophila whole body CDNA preparation with the primers shown in T03575 and T03576. The primers were constructed from portions of the amino acid sequences of the third and fourth extracellular domains of published cadherin sequences. The cytoplasmic domain of cadherins of interacts with the cytoplasmic domains and other cytoplasmic domains and cadherins adhesive function. The cadherins which do not possess a cadherins absive function. The cadherins which do not possess a cytoplasmic domain appear to function via a different method from those with a cytoplasmic domain. These protein sequences are involved in cell-cell adhesion. These sequences may have regulatory functions in the cell, as well as the cell-cell adhesive properties. Antibodies produced against these sequences are useful for modulating the binding activity of these protocadherins, and can be used therapeutically.
                                                                                                                                                                                                                                             29-AUG-1996 (first entry)
Protocadherin clone DROSOPHILA-12.

Erythrobacter sp. phytoene dehydrogenase and lycopene cyclase genes
for the prodn. of beta-carotine useful as a food colourant
for the prodn. of beta-carotine useful as a food colourant
for the prodn. of beta-carotine useful as a food colourant
for the prodn. of beta-carotine useful as a food colourant
for the prodn of the product of the lycopene cyclase enzyme from
Erythrobacter longus ARCC 14126. The corresp. gene was isolated from an
Erythropanase gene from Erwinia hebicola as a probe. The probe isolated
a nucleotide fragment which contained two open reading frames (ORF).
CORF2 (1578 bp) encodes the phytoene dehydrogenase (137198) whereas ORF1
(1302 bp) encodes lycopene cyclase. The two ORFs were inserted into the
plasmid pRR415 to generate pRKCD. This plasmid was transformed into
Rhodobacter sphaeroides for prodn. of the proteins. The phytoene
dehydrogenase and lycopene cyclase can be used to produce beta-carotine
for use as a food colourant or as a food additive with anti-cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
20-SEP-1996 (first entry)
Erythrobacter longus lycopene cyclase protein.
Phytoene dehydrogenase; Erythrobacter longus; Erwinia hebicola; probe; open reading frame; lycopene cyclase; Rhodobacter sphaeroides; beta-carotine; food colourant; additive; anti-cancer.

Identifying virulence genes in microorganisms - by introducing mutants with insertion inactivated genes into environment and mutants with insertion inactivated genes into environment and trainstant and analysis of mutants.

A method for identifying a microorganism having a reduced adaptation to a particular environment comprising the steps of: (1) providing a plurality of microorganisms each of which is independently mutated by the insertional inactivation of a gene with a nucleic acid comprising a unique marker sequence so that each mutant contains a different
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      07-JAN-1997 (first entry)

marker sequence, or clones of the said microorganism; (2) providing individually a stored sample of each mutant produced by step (1) and providing individually stored nucleic acid comprising the unique marker sequence from each individual mutant; (3) introducing a plurality of mutants produced by step (1) into the said particular environment and allowing those microorganisms which are able to do so to grow in the said environment; (4) retrieving microorganisms from the said environment; (4) retrieving microorganisms from cucleic acid from the retrieved microorganisms; (5) comparing any marker sequences in the nucleic acid isolated in step (4) to the unique marker sequence of each individual mutant stored as in step (2); and (6) selecting an individual mutant which does not contain any colthe marker sequences as isolated in step (4). The products and methods can be used for identifying virulence genes in microorganisms. The mutant microorganisms can be used in vaccines or to screen for drugs which reduce virulence or compounds useful for preventing, sequence 4472 AA;

Example 5: Page 109: 138pp; English.

R59496-R61666 are immunogenic 10mer peptides that contain a HLA-A2.1

Binding motif. These peptides bind HLA-A2.1 and have a binding affinity of at least 1% as compared to a reference peptide (R71293).

R61548 has an 1050 of 0.0036 and the sequence occurs at position 24 in the HPV E6 protein. The peptides of the invention can induce cytocoxic T lymphocytes which can react with target cells. They can be used for the treatment or prophlyaxis of cancer, eg. prostate
                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Til-MAY-1995 (first entry)
Peptide fragment (1.0914) of HPV binds HLA-A2.1.
Peptide fragment (1.0914) of HPV binds HLA-A2.1.

HPV-18 E GONA (diven in Q97848) was amplified from a HeLa cell CDNA library using the primers given in Q97846-47. The gene was subcloned into a baculovirus vector for expression of recombinant E6 in Sf9 insect cells for use as a component of an sequence 158 AA;

The sequences of the E6 and E7 polypeptide-encoding regions of human papillomavirus (HPV) 16 and 18 are given in 075470-71 and the encoded proteins in R63865-66, respectively. Probes and primers encoded proteins in R63865-66, respectively. Probes and primers based on these sequences were used for HPV infection diagnosis; expression of E6 and E7 is diagnostic for cervical cancer or pre-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

PT Nucleic acid sequence encoding an amphotropic retrovirus receptor
PT used to create viral vectors useful in gene therapy.

Claim 4; Fig 2; 24pp; English.

CQ 4311 encodes R63808 the amphotropic retrovirus receptor gibbon cleukaemia virus receptor 2 (GLNR2). Nucleotide fragments of Q74311

Can be used to create vectors, for use in human gene therapy and can be used to create vectors, for use in human gene therapy and GLNR2 gene and receptor. The nucleotide fragments can also be used as probes to study GLVR2 distribution in cells from various species.
Human neuroblastoma cell line, hippocampus, frontal and temporal cortex and visual cortex cDNA banks were screened with a probe containing carp skeletal muscle Ca-channel cDNA. The cDNA clone p1247-10.1.1.1 was sequenced and found to encode amino acids 1050 1512 including the end of the third domain (IIIs6) and the entire bomain IV and about 130 C-terminal flanking amino acids which correspond to the last cytoplasmic part of the protein. The human neuronal calcium channel proteins can be used for screening for calciumal ligands (agonists or antagonists). See also 029259-029275.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human amphotropic retrovirus receptor GLVR2.
Amphotropic retrovirus receptor; gibbon leukemia virus receptor 2; GLVR2; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DNA sequence glucosyl:transferase-I - comprises Streptococcus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   recombinant virus vectors encoding human papillomavirus proteins

recombinant virus vectors encoding human papillomavirus proteins

recombinant virus vectors encoding against HPV infections and

recombinant virus caused by them, such as cervical cancer

bisclosure; Fig 1b; 83pp; English.

The fragment of DNA contg, the HPV-18 E6/E7 coding region was

prepd. by PCR from plasmid pBR322/HPV16 (Boshart et al., EMBO J. 3;

[15] using oligonuclectides Sol and Sol. The prod. of the
second reading frame is the HPV-18 E6. The E6 and E7 ORFs are fused

reading frame encodes HPV-18 E6. The E6 and E7 ORFs are fused

reading frame encodes HPV-18 E6. The E6 and E7 ORFs are fused

reading frame of the HPV-18 E6. The E6 and E7 ORFs are fused

codens of the HPV E7 sequence. The single ORF of the TPV-18 E6/E7 may be
inserted into vaccinia virus DNA at neutral sites (pref. by inserting

two sets of the DNA in opposite orientations to overcome the problem

of intertypic recombination) to make a recombinant virus vector for
ganish HPV. See also R27723-43.

Claim 13; Page 15; 29pp; Japanese.

The DNA sequence from Streptococcus sobrinus strain 6715 encodes glucosyltransferase. I can mutants). The DNA was obtd. by treating 5. sobrinus 6715 with mutanolysin, extracting the chromosomal DNA, partially digesting with saulal and fractionating on agarose gel. The 3-5 kbp fragment was ligated into pUC18 and E. coli JM109 transformed with it. A GT-1 expressing clone was isolated and sequenced. The clone may be used in the development of a drug for Sequence 1592 AA;
sobrinus DNA sequence with at least one nucleotide added or

class
is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MRC HLA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 15; Page 36; 80pp; English.
R83061-R83085, R83096 and R92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is a diner of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CILS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 16-MAY-1996 (first entry)
HLA-B2702 CTL modulating peptide (B2702.84-75/84-75).
CYLOCOXIC T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.
                                                                                                                                                                                                                                                     H;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ∺ ;;

                                                                                                                                                                                                                                                                                                             Example 15; Page 36; 80pp; English.
R83061-R83085, R83090-R83096 and R93907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HLA-B7. These sequences can be used to extend the period of Coeptant of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to administration for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inibit) the activity of the cytotoxic T lymphocytes (CTLS) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 15; Page 36; 80pp; English.

R83061-R83085, R83090-R83096 and R93907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime modulate (or inibit) the activity of the cytotoxic T lymphocytes (CTLs) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                16-MAY-1996 (first entry)
HLA-B2702 CTL modulating peptide (B2702.84-75/75-84).

Pr Composing lymphoid surface membrane proteins - which may inhibit cytolytic activity and differentiation of CTLS.

Example: Page 18; 29pp; English.

PR 55-134027.735.

Tompsons. comprising lymphoid surface membrane proteins - which may inhibit cytolytic activity and differentiation of CTLS.

PR 55-134027.735.

Tompsons. compression antigens. This sequence represents the human-leucocyte-associated antigens. This sequence represents the R95413, and R95415-R95431 represent palindromes and fragments of isolate bunds last associated with T-cell lysate. P74 is a T-cell surface membrane cortaining a covalently bound with the heat shock protein HSC70.

CT 4 is found in a limited number of cell types, but is particularly coll with an amphoteric detergent, and then passed through an affinity coll with an amphoteric detergent, and then passed through an affinity coll with an amphoterising the extracellular fragment of P74 combined with the HLA-B2702.60-84 (see R95416), induces calcium influx, and inhibits compositions comprising the articellular fragment of P74 and determining the amount of binding between the candidate compound and p74.

CC compounds can be screened for their effect on the cytolysis. Candidate compound the amount of binding between the candidate composition containing T-cells and antigen presenting cells (APCS), by adding to the mix the extracellular portion of p74, in an amount sufficient to compete with the extracellular portion of p74, in an amount sufficient to compete the p74 for the p74 for the p74 ingand.

Example: Page 12; 29pp; English.  Example: Page 12; 29pp; English.  RS9413, and R85415-R95431 represent palindromes and fragments of chmman-leucocyte-associated antigens. This sequence represents the chmman-leucocyte-associated antigens. This sequence represents the comman page 12; 29pp; English.  CC HLA-B2702 84-75-84 palindrome. These sequences can be used to isolate the protein p74 from a T-cell lysate. p74 is a T-cell surface membrane of protein p74 from a T-cell lysate. p74 is a T-cell surface membrane of protein associated with real activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein Hsc70.  P74 is found in a limited number of cell types, but is particularly carpsessed on B and T cells. p74 can be issolated by lysis of a suitable cell with an amphotearic detergent, and then passed through an affinity compositions comprising the extracellular fragment of p74 combined with the A-B2702 palindromic peptide.  CC oumn containing the acreened for their effect on the cytolysis. Candidate compounds and be screened for their effect on the cytolysis.  CT-cells, by combining them with the extracellular portion of p74 and determining the amount of binding between the candidate compound and p74.  Modulation of CTL activity can be inhibited in a cellular composition

Example 15; Page 36; 80pp; English.

R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75.84 of the alpha-1 domain of the class I MHC HIA-B3702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 15; Page 36; 80pp; English.

R83061-R83085, R83090-R83096 and R92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CILS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PS5430 standard; peptide; 20 AA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example 15; Page 36; 80pp; English.

R83061-R83085, R83090-R83096 and R92907-R92914 represent fragments of class I major histocompatibility complex (WHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime modulate for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs) of the patient.
containing T-cells and antigen presenting cells (APCs), by adding to the mix the extracellular portion of p74, in an amount sufficient to compete with p74 for the binding of the p74 ligand.

Tompsons. comprising lymphoid surface membrane proteins - which may inhibit cytolytic activity and differentiation of CTLs.

Example 12, 29pp. English.

Example 12, 29pp. English.

RS5413, and RS5415.RS5431 represent palindromes and fragments of whan leucocyte-associated antigens. This sequence represents the HA-B2702 84-75775-847 palindrome. These sequences can be used too isolate the protein p74 from a T-cell lysate. p74 is a T-cell surface membrane protein associated with T-cell activation in mammalian T-cells, and isalso immunologically gross reactive with the heat shock protein Esc70. p74 is found in a limited number of cell types, but is particularly expressed on B and T cells. p74 can be isolated by lysis of particularly expressed on B and T cells. p74 can be isolated by lysis of a suitable cell with an amphorteric detergent, and then passed through an affinity column containing a covalently bound HIA-B2702 palindromic peptide. Compositions comprising the extracellular fragment of p74 combined with HIA-B2702.60-84 (see R95416), induces calcum influx, and inhibits cytotoxic T lymphocyte (CTL) differentiation or cytolysis.

Candidate compounds can be screened for their effect on the cytolytic activity of T-cells, by combining them with the extracellular portion of p74 and determining the amount of binding between the candidate compound on the anticell and antigen presenting cells (APCS), by adding to the mix the extracellular portion of p74, in an amount calcular portion of calcular portion of p74, in an amount calcular p

R83061-R83085, R83090-R83096 and R93907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of I MHC HIA-B2702. These sequences can be used to mantched donor. The peptides are administered to a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime Clayberger C, Krensky AM, Full Clayberger C, Krensky AM, Full Clayberger C, WPI; 95-358582/46.
Extension of acceptance period of transplants from MHC unmatched form hosts - using Class I B75-84 MHC antigen of the recipient

administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs) of the patient. ខ្លួន្ត

## ALIGNMENTS

```
Example 15; Page 36; 80pp; English.

R83061-R83085, R83090-R83096 and R92907-R92914 represent fragments of class I major histocompatibility complex (MRC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MMC HIA-B2702. These sequences can be used to extend the period of a coeptance by a recipient of a transplant from an MMC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to administration for a limited period of time (compared to the lifetime modulate (or limited period of time (compared to the lifetime modulate (or inibit) the activity of the cytotoxic T lymphocytes (CTLS) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 15; Page 36; 80pp; English.

R8306-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I amajor histocompatibility complex (WHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to abailent for a limited period of time (compared to the lifetime administration for a limited period of time (compared to the lifetime modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CILE) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             #822909; """" PEPLIGE; 20 AA.

R83061-R83085, R83090-R83096 and R93907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 15; Page 36; 80pp; English.
8381061-R83085, R81090-R83106 and R92007-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HLA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a
                                                                                                                                                                                                                                           16-MAY-1996 (first entry)
HLA-B2702 CTL modulating peptide (B2702.84-75(T)/75-84).
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant, graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         HLA-B2702 CTL modulating peptide (B2702.84-75(T)/75-84(T)). Cytocotic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

While of the proteins of the proteins of the may made in this composers. Comprising lymphoid surface membrane proteins - which may inhibit cytolytic activity and differentiation of CTLS.

Example 12, 29pp; English.

CC R94413, and R95415-R9543 represent palindromes and fragments of human-leucocyte-associated antigens. This sequences can be used to isolate the protein associated with T-cell lysate. P74 is a T-cells surface membrane protein p74 from a T-cell lysate. P74 is a T-cells surface.

CC membrane protein associated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein R570.

CC modification in almitted number of cells types, but is a suitable cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HHA-B3702 palindromic peptide. Compositions comprising the extracellular fragment of p74 combined with HLA-B2702.60.84 (see R95416), induces calcium influx, and inhibited compounds can be screened for their effect on the cytolytic cativity of T-cells, by combining them with the extracellular portion of p74 and determining the amount of binding between the candidate compound complete with p74 for the binding of the p74, in an amount composition compete with p74 for the binding of the p74 ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        12-NOV-1996 (first entry)
HIA-B3702 84-75T/75-84T palindrome.
HIA-B3702 84-75T/75-84T palindrome.
HIA-P3702 84-75T/75-84T human-leucoyte-associated antigen; inhibitor;

cytolysis; antigen presenting cell.
subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs)
                                                                                                                                                                                                                                                                                                                                                    ö

HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treadmont;) The peptides particularly modulate (or inhibit) the activity of the cyctoxic T lymphocytes (CILS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ĥ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     16-MAY-1996 (first entry)
HLA-B2702 CTL modulating peptide (B2702.75-84).
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC;
immunosuppressant; graft versus host disorder; transplantation; therapy;
class I MHC; HLA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs) of the patient.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
Immunosuppressant, graft versus host disorder, transplantation, therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 15; Page 9; 80pp; English.
R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor.
                                                                                                                                                                                                                                                    Example 15; Page 36; 80pp; English. R83061-R83085, R83090-R83096 and R92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is a dimer of residues 75-84 of the alpha-1 domain of the class I MHC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The peptides are administered to a patient in conjunction with a subtherspeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Tomprising lymphoid surface membrane proteins - which may inhibit cytolytic activity and differentiation of CTLS.

Tomple: Page 11; 29pp; English.

This sequence represents the alphal-helix of the fundan-leucocyte-associated antigen BDA20 (HLA-B2702). This sequence, epitopes, and palindromes of it (such as R95428) can be used to isolate the protein p74 from a T-cell lysate. P74 is a T-cell surface membrane protein associated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein H8c70.

P74 is found in a limited number of cell types, but is particularly capterseed on B and T cells. P74 can be isolated by 19sis of a suitable cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HLA-B2702 palindromic peptide. Column containing a covalently bound HLA-B2702 palindromic peptide. Column containing the extracellular fragment of p74 combined with HLA-B2702.60-84 (see R95416), induces calcium influx, and inhibits compositions comprising them with the extracellular portion of p74 and determining the amount of binding between the candidate compound and p74.

P7-cells, by combining them with the extracellular composition containing T-cells and antigen presenting cells (APCS), by adding to the cannon of the p74 in an amount sufficient to compete cannon.

R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 70.84 of the alpha-1 domain of the class I MHC HLA-B2702. These sequences can be used to extend the period of The peptides are administered to a patient from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to administration for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhbit) the activity of the cytotoxic T lymphocytes (CTLs) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô

Claim 11; Page 54; 51pp; English.
The peptide is used to modulate cytotoxic T-lymphocyte (CTL)
activity, either by inhibition or stimulation. It can be used
for inhibiting CTL toxicity in transplantations, for inducing CTL
activity in parasitic diseases and neoplasia and in studies on viral
infection. The peptide can also be used for identifying CTLs which
bind to it and removing subsets of CTLs from a T-cell composition.
This peptide sequence is more commonly found within larger peptide
compounds of not more than 30 amino acids in length.

R95413, and R94415-R95431 represent palindromes and fragments of human-leucocyte-associated antigens. This sequence represents than 1-1 page 1.

English 1. These sequences can be used to isolate the protein p74 is a T-cell surface membrane protein associated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein Hsc70. p74 is found in a limited number of cell types, but is particularly expressed on B and T cells.

English 2,4 can be isolated by lysis of a suitable cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HiA-B2702 palindromic peptide.

C Compositions comprising the extracellular fragment of p74 compined with this sequence, induces calcium influx, and inhibits cytotoxic T lymphocyte (CTL) differentiation or cytolysis. Candidate compounds can

be screened for their effect on the cytolytic activity of T-cells, by combining them with the extracellular portion of p74 and determining the amount of binding between the candidate compound and p74. Modulation of CTL activity can be inhibited in a cellular composition containing treells and antique presenting cells (APCS), by adding to the mix the extracellular portion of p74 in an amount sufficient to compete with p74 for the binding of the p74 ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     HIAB38 CTL modulating peptide (B38.6084).

The peptide (or a fragment of at least 10 amino acids, joined at at least one terminus to a sequence other than that of wild type HLA antigen) is used to modulate cytotoxic T-lymphocyte (CTL) activity, antigen, or stimulation. It can be used for inhibiting CTL toxicity in transplantations, for inducing CTL activity in parasitic diseases and neoplasia and in studies on viral linfection. The peptide can also be used for inducing CTLs which bind to it and removing subsets of CTLs from a T-cell composition.
                                                                                                                                                                                                                                                                                                                                                 Gaps

R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of Class I major histocompatability complex (MHC) antiqees. This sequence corresponds to residues 60-84 of the alpha-1 domain of the class I MHC HIAB38. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unnatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the sequence 25 AA;

Claim 3; Page 2; 13pp; Japanese.

Probes comprising part of the DNA sequence encoding the protein can be used to identify class I genes. The DNA can be expressed for immunisation of animals and prodn. of monoclonal antibodies specific for the HLA-C antigen. See also R12466 (same patent) and J03112486.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human leukocyte antigen; probe; major histocompatibility complex; MHC; class I. Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         19-MAR-1991 (first entry)
Sequence of HLA-B51 antigen.
Probe; HLA class I DNA; immunogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        m "A-Geneseq 26")

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            68
                                                                                                                                                                                                                                                                                HIA-C gene, DNA probe and transformant cells - for immunisation of animals and monoclonal antibody development.

Claim 4: Page 2: 13pp; Japanese.

Probes comprising part of the DNA sequence encoding the protein can be used to identify class I genes. The DNA can be expressed for immunisation of animals and prodn. of monoclonal antibodies specific for the HIA-C antigen. See also R12465 (same patent) and J03112486

HLA-B35 gene - used in DNA probe and transformant cells for HLA-B35 gene - used in DNA probe and transformant cells for lumnishing animals, for developing monoclonal antibody.
Claim 1; Page 1; 11pp; Japanese.
Probes comprising part of the sequence encoding this sequence can be used to identify Class I genes. The DNA can be expressed for lumnisation of animals and prodn. of monoclonal antibodies specific for the HLA-B35 antigen. See also J03112485 and J03112487.

           New peptide(s) based on Class I HLA antigen domains - used for modulating cytotoxic T-lymphocyte activity towards targets modulating cytotoxic T-lymphocyte activity towards targets claim 8: Page 53; 61pp; English.

The peptide (or a fragment of at least 10 amino acids, joined at at least one terminus to a sequence other than that of wild type HLA antigen) is used to modulate cytotoxic T-lymphocyte (CTL) activity, in paragitic of stimulation. It can be used for inhibiting CTL toxicity in transplantations, for inducing CTL activity in paragitic diseases and neoplasta and in studies on viral infection. The peptide can also be used for identifying CTLs and to it and removing subsets of CTLs from a T-cell composition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    15-MAR-1994 (first entry)

The weptide(s) based on Class I HLA antigen domains - used for modulating cytotoxic T-lymphocyte activity towards targets

Claim 10; Page 54; 61pp; English.

The peptide (or a fragment of at least 10 amino acids, joined at at least one terminus to a sequence other than that of wild type HLA antigen) is used to modulate cytotoxic T-lymphocyte (CTL) activity,

Claim 10; Page 54; 61pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        mew poptide(s) based on class I HLA antigen domains - used for modulating cytotoxic T-lymphocyte activity towards targets or claim 11; Page 54; 61pp; English.

The peptide is used to modulate cytotoxic T-lymphocyte (CTL) activity, either by inhibition or stimulation. It can be used for inhibiting CTL toxicity in transplantations, for inducing CTL activity in parasitic diseases and neoplasia and in studies on viral infection. The peptide can also be used for identifying CTLs which bind to it and removing subsets of CTLs from T-cell composition. This peptide sequence is more commonly found within larger peptide compounds of not more than 30 amino acids in length.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        15-MAR-1994 (first entry)
Peptide fragment of Class I HLA peptide.
Human leukocyte antigen; HLA; peptide; transplantation; neoplasia; parasitic disease; cytotoxic T lymphocyte; modulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ∺ ;;

                                                                                                          Mew peptide(s) based on class I HLA antigen domains - used for modulating cytotoxic T-lymphocyte activity towards targets claim 11; Page 54; flpp; English.

The peptide is used to modulate cytotoxic T-lymphocyte (CTL) activity, either by inhibition or stimulation. It can be used for inhibiting CTL toxicity in transplantations, for inducing CTL activity in parasitic diseases and neoplasta and in studies on viral infection. The peptide can also be used for identifying CTLs which bind to it and removing subsets of CTLs from a T-cell composition. This peptide sequence is more commonly found within larger peptide compounds of not more than 30 amino acids in length.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Clayberger CA, Krensky AM;

New peptide(s) based on Class I HLA antigen domains - used for modulating cytotoxic T-lymphocyte activity towards targets
Example 13; Page 39; 61pp; English.

The peptide is used to modulate cytotoxic T-lymphocyte (CTL)
activity, ather by inhibition or stimulation. It can be used for inhibiting CTL toxicity in transplantations, for inducing CTL activity in parasitic diseases and neoplasia and in studies on viral infection. The peptide can also be used for identifying CTLs which bind to it and removing subsets of CTLs from a T-cell composition. This peptide is derived from the HLA-B38 antigen and corresponds to make the amino acid positions 60-84 of that antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         15-MAR-1994 (first entry)
Peptide fragment of HLA-B38 antigen.
Human leukocyte antigen; HLA, peptide; transplantation; neoplasia;
Barasitic disease; cytotoxic T lymphocyte; modulation.
Synthetic.
W09317699-A.
                                      15-MAR-1994 (first entry)
peptide fragment of Class I HLA peptide.
Human leukocyte antigen: HLA, peptide; transplantation; neoplasia;
parasitic disease; cytotoxic T lymphocyte; modulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      H ;

R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 75-84 of the alpha-1 domain of the class I MHC HLA-E2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a
                                                                                                                                                                                                                                                                                                          Clayberger C, Krensky AM, Parham P;
WPI; 95-358582/46.
Extension of acceptance period of transplants from MHC unmatched
donor hosts - using Class I B75-84 MHC antigen of the recipient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Clayberger C, Krensky AM, Parham P;

HLA-B7 CTL modulating peptide (B7.84-75/75-84).
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B7.
                                                                      (CIIS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example 15; Page 36; 80pp; English.

R83061-R83086, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 70-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLS)
         ဌ
      This is administered
subtherapeutic amount of an immunosuppressant. This is administere the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Η;

R92913; HLA-B7 CTL modulating peptide (B7.84-75/75-84).

(from "A-Geneseq 26")

ID R92913 standard; peptide; 20 AA.

R92913;

DT 16-MX-1996 (first entry)

DE HLA-B7 CTL modulating peptide (B7.84-75/75-84).

KW Cytotoxic T lymphocyte; CTL; major histocompatibility of munosuppressant; graft versus host disorder; transplaces synthetic.

NW 909526979-A1.

PN W09526979-A1.

Example 15; Page 36; 80pp; English.
R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HLA-B7. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (comparate to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 13; Page 32; 80pp; English.
R83061-R83085, R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 60-84 of the alpha-1 domain of the class acceptance by a recipient of a transplant from an NHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to administration of time (compared to the lifetime administration for unrest treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CILS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           HLA-Bw46 CTL modulating peptide (Bw46.60-84).
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC;
immunosuppressant; graft versus host disorder; transplantation; therapy;
class I MHC; HLA-Bw46.
                                                                                                                                                                                                                                                                                                                        H >
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Extension of acceptance period of transplants from MHC unmatched donor hosts - using Class I B75-84 MHC antigen of the recipient

HIA-B2702 CTL modulating peptide (B2702.75-84(D)).
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC;
immunosuppressant; graft versus host disorder; transplantation; therapy;
class I MHC; HLA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   I match found in sequence:

R83094; HLA-B2702 CTL modulating peptide (B2702.75-84(D)).

(from "A-GeneSeq 26")

ID R83094 standard; peptide; 10 AA.

AC R83094;

DT 16-MAY-1996 (first entry)

DE HLA-B2702 CTL modulating peptide (B2702.75-84(D)).

KW Cytotoxic T lymphocyte; CTL; major histocompatibility companimumosuppressant; graft versus host disorder; transplantt KW class I MHC; HLA-B2702.

Synthetic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      qicktntqtyrenlrialry 16
                                                                                                                                                                                                                                                                                                                                                                                                              Example 13; Page 32; 80pp; English.

R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatability complex (MRC) antigens. This sequence corresponds to residues 60-84 of the alpha-1 domain of the class I MRC HLA-Bw62. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MRC unnatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLS) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 13; Page 32; 80pp; English.
R83061-R83085, R83090-R83096 and R92307-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 60-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to
                                                                                                                HLA-Bw62 CTL modulating peptide (Bw62.60-84).
Cytocovaic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-Bw62.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              16-MAY-1996 (first entry)
HIAA-B2702 CTL modulating peptide (B2702.60-84).
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HIA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  # >

Example 13; Page 32; 80pp; English.

R83061-R83085, R8309-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MRC) antigens. This sequence corresponds to residues 60-84 of the alpha-1 domain of the class I MHC HIAB38. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for a current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLs) of the patient.
      the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              16-MAY 1996 (first entry)
HLAB38 CTL modulating peptide (B38.6084).

                                                              Example 14; Page 34; 80pp; English.

Example 14; Page 34; 80pp; English.

Example 1835 I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 75.84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 14; Page 34; 80pp; English.

R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 75-84 of the alpha-1 domain of the class I MHC HIA-R2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       16-MAY-1996 (first entry)

R83061-R83085, R83090-R83096 and R92907-R92914 represent fragments of R83061-R83085, R83090-R83096 and R92907-R92914 represent fragments of Lass I major histocompatibility complex (MHC) antigens. This sequence is an inverted diner of residence 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherspeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 15; Page 36; 80pp; English.

Comparising lymphoid surface membrane proteins - which may compares. comprising lymphoid surface membrane protein of CTLs.

Example: Page 11: 29pp: English.

This sequence represents the alphal-helix of the man eleucocyte-associated antigen B2702 (BLA-B2702). This sequence, epitopes, and palindromes of it (such as R95428) can be used to isolate the protein p74 from a T-cell lysate. P74 is a T-cell surface membrane protein p74 from a T-cell lysate. P74 is a T-cell surface membrane protein p74 from a T-cell lysate. P74 is a T-cell surface membrane protein p74 from a T-cell lysate. P74 is a T-cell surface membrane protein associated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein HSCTO.

P74 is found in a limited number of cell types, but is particularly captured in amphoteric detergent, and then passed through an affinity cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HLA-B2702 palindromic peptide.

Compositions comprising the extracellular fragment of P74 combined with HLA-B2702.60-84 (see R95416), induces calcum influx, and inhibits composition of CTL activity can be inhibited in a cellular composition of CTL activity can be inhibited in a cellular composition of CTL activity can be inhibited in a cellular composition of CTL activity can be inhibited in a cellular composition of CTL activity can be inhibited in a cellular composition of CTL activity can be inhibited in a cellular composition of CTL activity can be inhibited in a cellular to compete mix the extracellular portion of P74 in an amount sufficient to compete component to the P74 ilgand.
                                                                                                                                                                                                                                                            12-NOV-1996 (first entry)

Habition of CTL activity by the manner of the protein of CTL with an amploteric detergent, and Habition of CTL activity of CTL with a sequence associated antigens. This sequences can be used to isolate the protein p74 from a T-cell lysate. p74 is a T-cell surface membrane controlly associated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein Hsc70. CTL is found in a limited number of cell types, but is particularly conversed on B and T cells. p74 can be isolated by lysis of a suitable cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HLA-B2702 palindromic peptide. CC compositions comprising the extracellular fragment of p74 combined with HLA-B2702.60-84 (see R95416), induces calcium influx, and inhibits cytotoxic T lymphocyte (CTL) differentiation or cytolysis. Candidate CC compounds can be screened for their effect on the cytolytic activity of creening the amount of binding between the candidate compound and p74. Modulation of CTL activity can be inhibited in a cellular composition containing T-cells and antigen presenting cells (APCS), by adding to the companion of p74. In an amount sufficient to compete with p74 for the binding of the p74 ligand.

R95413, and R95415-R95431 represent palindromes and fragments of human-leucocyte-associated antigens. This sequence represents the HLA-B2702 84-757/75-84T palindrome. These sequences can be used to isolate the protein p74 from a T-cell lysate. p74 is a T-cell surface membrane protein associated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein HSC70. p74 is found in a limited number of cell types, but is
                                                                                                                                                                                                                                                                                                                                            Compsns. comprising lymphoid surface membrane proteins - which may inhibit cytolytic activity and differentiation of CTLs. restriction of the management of the properties of a suitable cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HLA-B2702 palindromic compositions comprising the extracellular fragment of py4 combined with HLA-B2702.60-84 (see R95416), induces calcium influx, and inhibits cytocoxic 1ymphocyte (CTL) differentiation or cytolysis.

CC andidate compounds can be screened for their effect on the cytolytic cativity of T-cells, by combining them with the extracellular portion of py4 and determining the amount of binding between the candidate compound composition containing T-cells and antigen presenting cells (APCS), by adding to the mix the extracellular portion of py4.

C composition containing T-cells and antigen presenting cells (APCS), by sequence 20 AA;

S sequence 20 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PR 10-7807-1993; US-150493.

CC HIA-B7.60-84. These sequences can be used to isolate the protein p74 from a r-cell lysate. p74 is a T-cell surface membrane protein p74 from a rocal lycross reactive with the heat shock protein p74 from associated with r-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein p74 is containing a covalently bound HLA-B702 palindromic peptide.

C found in a limited number of cell types, but is particularly expressed on a page 12: p74 can be isolated by lysis of a suitable cell with an ampouteric detergent, and then passed through an affinity column containing a covalently bound HLA-B702 palindromic peptide.

C mopositions comprising the extracellular fragment of p74 combined with the extracellular fragment of p74 condiate compound and p74.

C T-cells, by combining them with the extracellular portion of p74 and determining the amount of binding between the contoint composition containing T-cells and antigen presenting cells (APCs), by adding to the mix the extracellular portion of p74 in an amount sufficient to compete with p74 for the binding of the p74 ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   12-NOV-1996 (first entry)

PT Compens. Comprising lymphoid surface membrane proteins - which may inhibit cytolytic activity and differentiation of CTLS.

Example; Page 9; 29pp; English.

CK SP$413, and R99415-R95431 represent palindromes and fragments of thuman-leucocyte-associated antigens. This sequence represents the human-leucocyte-associated antigens. This sequence represents the human-leucocyte-associated antigens. This sequence represents the charmon-leucocyte-associated antigens. This sequence represents the thuman-leucocyte-associated antigens. This sequence represents the number of claybration in mammalian T-cells, and is also cammunologically cross reactive with the heat shock protein Hsc70. P74 is found in a limited number of cell types, but is particularly expressed on the amphoreric detergent, and then passed through an affinity column containing a covalently bound HLA-B2702 palindromic peptide.

CC compositions compressing the extracellular fragment of P74 combined with CHA-B2702.60-84 (see R95416), induces calcium influx, and inhibits compounds can be screened for their effect on the cytolysis. Candidate

Compsis. comprising lymphoid surface membrane proteins - which may inhibit cytolytic activity and differentiation of CTLs.

Thibit cytolytic activity and differentiation of CTLs.

Example; Page 9; 29pp; English.

R95413, and R95415-R95431 represent palindromes and fragments of human-leucocyte-associated antigens. This sequence represents champer-leucocyte-associated antigens. This sequence represents from a T-cell lysate. P74 is a T-cell surface membrane protein p74 from a T-cell lysate. P74 is a T-cell surface membrane protein p74 from a T-cell lysate. P74 is a T-cell surface membrane protein p74 from a T-cell with T-cell activation in mammalian T-cells, and is also a mambologically cross reactive with the heat shock protein Hsc70. P74 is found in a limited number of cell types, but is particularly expressed on mamphoteric detergent, and then passed through an affinity column containing a covalently bound HLA-B2702 palindromic peptide.

Compositions comprising the extracellular fragment of p74 combined with the extracellular fragment of p74 compounds can be screened for their effect on the cytolytic activity of T-cells, by combining them with the extracellular portion of p74 and determining the combining the mount of binding between the candidate composition containing T-cells and antigen presenting cells (APCS), by adding to the mix the extracellular portion of p74, in an amount sufficient to compete with p74 for the binding of the p74 ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   HLA: p74; alphal-helix; human-leucocyte-associated antigen; inhibitor; T-cell lysate; membrane protein; mammal; heat shock protein; Hsc70; APC; B cell; calcium influx; cytotoxic I lymphocyte; CIL; differentiation;

While 97-19402/120.

PT Composes. comprising lymphoid surface membrane proteins - which may inhibit cytolytic activity and differentiation of CTLS.

PS Example 39, 29pp. English.

Example 39, 29pp. English.

CR 95413, and R95415-R95431 represent palindromes and fragments of human-leucocyte-associated antigens. This sequence represents the CC HAL-BW62.60-84. These sequences can be used to isolate the protein p74 is a T-cell surface membrane protein p74 is a recall unannellar recells, and is also common optically cross reactive with the heat shock protein H870. Drive with an affiliality column containing a covalently bound HIA-B702 principle cell with an amphorate detergent, and then passed through an affiliality column containing a covalently bound HIA-B702 principle pptide.

Containing a covalently bound HIA-B702 palindromic peptide.

Containing the amount of the extracellular portion of p74 and determining the amount of binding between the candidate composition containing T-cells and antigen presenting cells (APCS), by adding to the mix the extracellular portion of p74, in an amount sufficient to compete with p74 for the binding of the p74 ligand.
               determining the amount of binding between the candidate compound and p74. Modulation of CTL activity can be inhibited in a cellular composition of containing T-cells and antigen presenting cells (APCS), by adding to the mix the extracellular portion of p74, in an amount sufficient to compete with p74 for the binding of the p74 ligand.

human-leucocyte-associated antigens.

This sequence represents the human-leucocyte-associated antigens.

This sequence represents the human-leucocyte-associated antigens.

The E2702.75-84(D). These sequences can be used to isolate the protein p74 from a T-cell lysate. p74 is a T-cell surface membrane protein cassociated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein Hsc70. p74 is found in a limited number of cell types, but is particularly expressed on containing a covalently bound then passed through an affinity column containing a covalently bound Hzh-B2702 palindromic peptide.

Compositions comprising the extracellular fragment of p74 combined with Hzh-B2702.60-84 (see R95416), induces calcium influx, and inhibits cytocoxic Tlymphocyte (CTL) differentiation or cytolysis. Candidate compounds can be screened for their effect on the cytolytic activity of companing them with the extracellular portion of p74 and determining the amount of binding between the candidate composition containing T-cells and antigen presenting cells (APCS), by adding to the containing T-cells and antigen presenting cells (APCS), by adding to the with p74 for the binding of the p74 ligand.

Sequence 10 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ennis, P.D.; Zemmour, J.; Salter, R.D.; Parham, P. The most conspicuous clustering of variability between the -B40 and -B7 alleles occurs between residues 63-74. This segment and residues 147-156 are possible alloantigenic determinants of these
  -C antigens: relatedness to immunoglobulins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Lopez de Castro, J.A.; Bragado, R.; Strong, D.M.; Strominger
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Biochemistry (1983) 22:3961-3969
Primary structure of papain-solubilized human
histocompatibility antigen HLA-B40 (-Bw60). An outline of
alloantigenic determinants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                #domain signal sequence #status predicted #label SIG\
